

The verified AI layer for tech events.

Every answer sourced, cited, and token-optimised by [SigMap](#). Zero hallucination — by construction.

Progress × GitNation Hackathon

JSNation + React Summit · Amsterdam 2026

THE PROBLEM

Conference chatbots hallucinate.

GENERIC LLM

Invents speakers, wrong times, wrong rooms. Confidently. No sources, no way to check.

STATIC SCHEDULE PAGE

Accurate, but no AI. You scroll, search, and hope. No natural-language answers.

No existing tool is **grounded in real event data** — and none **shows its work**.

THE SOLUTION

Not a chatbot. A verification layer.

SigMap pre-filters the entire conference corpus to only the relevant chunks **before any token reaches Gemini** — then verifies every factual claim in the answer against those chunks.

~60–97%

input tokens cut by SigMap

0.3–2s

first token (streaming)

100%

claims cited & verified

0

hallucinations — it declines

One process. Five steps. Fully transparent.

1 · SigMap retrieve

In-memory TF-IDF scores the corpus, returns the top relevant chunks
— or declines if nothing is grounded.

2 · Ground the prompt

Cite-or-decline rules wrap the verified context. The model is never
asked an ungrounded question.

3 · Gemini 2.5 Flash

Streams the answer token-by-token with real usage metadata.

4 · Verify + 5 · Suggest

Claim-by-claim faithfulness grade, cost, and smart follow-up questions
— streamed live to the trust panel.

WHAT YOU CAN DO

Four roles, one verified source.

Ask

Cited Q&A with a live token + trust panel on every reply.

Sessions

KendoReact Grid with natural-language AI filtering.

Agenda

Time-blocked personal schedule with conflict view.

Organiser

Engagement + coverage gaps: what attendees asked that no session answers.

The same retrieval layer powers **answers, filtering, and analytics.**

BUILT ON

Google stack, end to end.

- **Gemini 2.5 Flash** — streaming LLM with thinking + usage metadata
- **Google Stitch** — 4 screens designed from prompts in an hour
- **Google Cloud Run** (Amsterdam, europe-west4) — containerised, zero-infra deploy
- **KendoReact** — Grid, TileLayout, ProgressBar, Loader (Progress 2026)
- **Next.js 15** — App Router, SSE, standalone build
- **SigMap** — the verification + retrieval layer that makes it trustworthy

Three things no other team has.

1 · It refuses to lie

Zero-hallucination isn't a prompt — it's structural. No grounded context, no answer.

2 · It demos on the judges' own data

Their sessions. Their speakers. Recognition = credibility.

3 · It shows its work

Token savings, latency, citations, faithfulness — live on every answer.

Verified AI for your conference.

Live now · open source · powered by SigMap · built in 24 hours.
